

LABORATORY RECORD

Course: Full Stack Web Development

Experiment No.: 1

Student Name: T. Ushasri

Roll No.: A24126552120

1. TITLE

Develop a Pure Semantic HTML Static Webpage Without CSS

2. AIM

To develop a static webpage using pure HTML without CSS and to organize the content using semantic structural elements such as header, nav, section, main, article, aside, form, fieldset, legend and footer.

3. OBJECTIVE

- To understand the basic structure of an HTML document.
- To understand and use semantic HTML5 elements.
- To create a webpage using HTML without CSS.
- To create navigation links using the nav element.
- To organize content using section, main and article.
- To create a sidebar using the aside element.
- To create an interactive form using HTML form elements.
- To use fieldset and legend for grouping form controls.
- To use label, input, select and textarea elements.
- To create a footer using the footer element.
- To observe how a browser displays raw HTML using its default styles.

4. THEORY

HTML stands for HyperText Markup Language. It is the standard markup language used to create and structure content on web pages. Semantic HTML means using HTML elements that clearly describe the meaning and purpose of the content they contain.

Important Semantic Elements: header represents the introductory/top section; nav contains navigation links; section groups related content; main represents primary content; article represents independent content; aside contains supporting information; form collects user information; fieldset groups related controls; legend describes a fieldset; and footer represents the bottom section of a webpage.

The webpage is created without CSS. Therefore, the browser uses its default styling to display headings, paragraphs, links, forms and other HTML elements.

5. ALGORITHM / PROCEDURE

1. Create a new HTML file.
2. Add the HTML5 document declaration using .
3. Create the html, head and body sections.
4. Add the webpage title inside the title element.

5. Create a header section and add the website title StaticWeb.
6. Create a navigation menu using the nav element.
7. Add links for Home, Articles, About and Contact.
8. Create the Home section using the section element.
9. Add a heading, description and article navigation link.
10. Create the main webpage content using the main element.
11. Create articles using the article element.
12. Add information about core structural tags.
13. Create a User Inquiry Form using form and fieldset.
14. Add text, email, select and textarea controls.
15. Add Submit and Reset buttons.
16. Create the sidebar using the aside element.
17. Add unordered and ordered lists to the sidebar.
18. Create the footer using the footer element.
19. Save the file with the .html extension.
20. Open the file in a web browser and verify the navigation and form controls.

6. PROGRAM

File Name: static_webpage.html

```
<!DOCTYPE html>
<html>
<head>
  <title>Static Webpage</title>
</head>

<body>

  <!-- Header -->
  <header>
    <h1>StaticWeb</h1>

    <!-- Navigation -->
    <nav>
      <a href="#home">Home</a> |
      <a href="#articles">Articles</a> |
      <a href="#about">About</a> |
      <a href="#contact">Contact</a>
    </nav>
  </header>

  <hr>

  <!-- Home Section -->
  <section id="home">
    <h2>Semantic HTML Webpage</h2>
    <p>
      This webpage is created using simple HTML
      without CSS.
    </p>
    <a href="#articles">Read Articles ↓</a>
  </section>

  <hr>

  <!-- Main Content -->
  <main id="articles">

    <!-- Article 1 -->
    <article>
      <h2>1. Core Structural Tags</h2>
      <p>Published: July 7, 2026</p>

      <p>
        HTML provides semantic tags like
        main, article and section to organize
        webpage content.
      </p>

      <p>
        These tags make the webpage easy to
        understand and accessible.
      </p>
    </article>

    <hr>

    <!-- Article 2 -->
    <article>
      <h2>2. User Inquiry Form</h2>
      <p>Published: July 5, 2026</p>

      <form id="contact">

        <fieldset>
          <legend>User Inquiry Form</legend>

          <label>Name:</label>
          <input type="text" required>
          <br><br>

          <label>Email:</label>
          <input type="email" required>
          <br><br>

          <label>Topic:</label>
```

```

        <select>
            <option>General Feedback</option>
            <option>Technical</option>
            <option>Academics</option>
        </select>
        <br><br>

        <label>Message:</label><br>
        <textarea rows="5" cols="30"></textarea>
        <br><br>

        <input type="submit" value="Submit">
        <input type="reset" value="Clear">

    </fieldset>

</form>
</article>

</main>

<hr>

<!-- Sidebar -->
<aside id="about">
    <h3>About</h3>

    <p>
        Static webpages display information
        without a database.
    </p>

    <h4>Benefits</h4>

    <ul>
        <li>Fast loading</li>
        <li>Low memory usage</li>
        <li>Easy to understand</li>
    </ul>

    <h4>Components</h4>

    <ol>
        <li>HTML Document</li>
        <li>Semantic Tags</li>
        <li>Form Elements</li>
    </ol>
</aside>

<hr>

<!-- Footer -->
<footer>
    <p>
        © 2026 StaticWeb. Created using HTML.
    </p>
</footer>

</body>
</html>

```

7. CODE EXPLANATION

- Declares that the document uses HTML5.
- Root element of the HTML document.
- Contains metadata and page information.
- Sets the title shown in the browser tab.
- Contains the website heading and navigation.
- Contains links to different sections of the webpage.
- Groups related content into a meaningful section.
- Contains the primary webpage content.
- Represents an independent piece of content.
- Collects information from the user.
- and** — Groups related form controls and gives the group a title.
- Provides additional information in the sidebar.
- and** — Create unordered and ordered lists.
- Displays the bottom section and copyright information.

8. RESULT

A static semantic HTML webpage named StaticWeb was created successfully using pure HTML without CSS. The webpage contains navigation links, semantic sections and articles, a User Inquiry Form, an About sidebar with lists, and a footer.

9. CONCLUSION

The experiment demonstrates how semantic HTML5 elements can be used to structure a clear, accessible and organized static webpage without using CSS.
